These papillae mainly contain callose, but also contain carbohydrate, phenols and proteins and are used to prevent penetration of the fungal hyphae into the plant. The new Mlo sequences are used to generate transgenic plants resistant to fungal pathogens,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     especially Erysiphe

Mlo proteins given resistance to fungal pathogens which infect living epidermal plant cells Mlo proteins give proteins resistance to fungal pathogens, especially Erysiphe graminis (powdery mildews). In barley, mutations at the Mlo locus are responsible for a plant resistant pathotype. The mechanism of Mlo resistance involves the formation of large cell wall appositions, called papillae, at pathogen contact sites. Papillae mainly contain callose, but also carbohydrates, phenois and proteins. Polynucleotides encoding Mlo proteins are useful for making transgenic plants, preferably wheat, which are resistant to fungal pathogens.

                                                                                                                                                                                                                                                                                                                                        The present sequence represents a MIO protein. MIO proteins given resistance to fungal pathogens which infect living epidermal plant cells MIO proteins give proteins resistance to fungal pathogens, especially Erysiphe graminis (powdery mildews). In barley, mutations at the MIO locus are responsible for a plant resistant pathotype. The mechanism of MIO resistance involves the formation of large cell wall appositions, called papillae, at pathogen contact sites. Papillae mainly contain callose, but also carbohydrates, phenols and proteins. Polynucleotides encoding MIO proteins are useful for making transgenic plants, preferably wheat, which are resistant to fungal pathogens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim

These papillae mainly contain callose, but also contain carbohydrate, phenols and proteins and are used to prevent penetration of the fungal hyphae into the plant. The new Mlo sequences are used to generate transgenic plants resistant to fungal pathogens, especially Erysiphe graminis (powdery mildew).

Mlo proteins given resistance to fungal pathogens which infect living epidermal plant cells Mlo proteins give proteins resistance to fungal pathogens, especially Erysiphe graminis (powdery mildews). In barley, mutations at the Mlo locus are responsible for a plant resistant pathotype. The mechanism of Mlo resistance involves the formation of large cell wall appositions, called papillae, at pathogen contact sites. Papillae mainly contain callose, but also carbohydrates, phenols and proteins. Polynucleotides encoding Mlo proteins are useful for making transgenic plants, preferably wheat, which are resistant to fungal pathogens.

Down-regulation or out-competition of MLO function may be used to stimulate a defence response in transgenic plants conferring increased pathogen resistance, especially resistance to powdery mildew or rust. The product can also be used for identifying compounds able to stimulate a defence response in a plant by interaction with

                                   The sequence is that encoded by a homologue of the MIO gene, wild-type MIO exerts a negative regulatory function on a pathogen defence response, such that mutants exhibit a defence response in the absence of pathogen. Down-regulation or out-competition of MIO function may be used to stimulate a defence response in transgenic plants conferring increased pathogen resistance, especially resistance to powdery mildew or rust. The product can also be used for identifying compounds able to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence is a southern corn leaf blight resistance (SCLBr) protein of the invention. A chimeric gene containing the SCLBr coding sequence, can be used to alter the level of expression of a SCLBr protein in a host cell. The nucleic acid fragments can be used as probes, or to synthesize primers, to obtain further nucleic acid fragments or homologues encoding all or a substantial portion of the amino acid sequence encoding a SCLBr protein. The polynucleotides are useful for the production of transgenic plants having altered resistance to certain diseases, such as leaf blight disease caused by the fungus Helminthosporium maydis in corn (Zea mays).

                                                                                                                        The present sequence is the maize MLO6 (ZmMLO6) protein, which exhibits sequence homology to barley MLO1 (HvMLO1) sequence. MLO6 protein is encoded by a mutation-induced recessive allele MLO6, located on chromosome 5, that confers resistance to plant pathogens. Expression of native MlO genes in plants can be altered by transforming them with a DNA construct comprising the mutated Mlo gene. Decreasing the expression or activity of native MLO protein leads to enhanced resistance of plants against pathogens such as fungi, virus, nematodes and insects. Mlo gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Domain

These papillae mainly contain callose, but also contain carbohydrate, phenols and proteins and are used to prevent penetration of the fungal hyphae into the plant. The new Mio sequences are used to generate transgenic plants resistant to fungal pathogens, especially Erysiphe graminis (powdery

In the TJ Close lab at the University of California, Riverside, total RNA was prepared from each sample pool, equal quantities of all three RNA pools were combined, poly(A) RNA was purified from the mixture, one primary unamplified cDNA library was made, and 1 million pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids (Choi, Close). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were pared value 20 or above. For more details on library preparation and sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or above. For more details on library preparation and sequence analysis see http://www.genome.clemson.edu/projects/barley. To order this clone see http://www.genome.clemson.edu/projects/barley. To order this close TJ, Wing R, Kleinhofs A, Wise R (2001) Genetically and physically anchored EST resources for barley genomics. Barley Genetics Newsletter 31:29-30. In the TJ Close lab at the University of California, Riverside, total RNA was prepared from each sample pool, equal quantities of all three RNA pools were combined, poly(A) RNA was purified from the mixture, one primary unamplified cDNA library was made, and I million pfu were in vivo excised to give pluescript SK(-) cDNA phagemids (Choi, Close). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum Perparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates Performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates Performed at COGI (Wing, Yu, Frisch, Henry, Simmons, Oates Performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates Performed and contains a minimum of 100 bases of phred value 20 or above. Roots were harvested. The tissue, total RNA, and poly(A) RNA were prepared, a cDNA library was made, and the cDNA clones were in vivo excised to give pBluescript phagemids in the TJ Close lab (Choi, Close, Fenton) at the University of California, Riverside. Plasmid DNA preparations and DNA sequencing were performed in the OD Anderson lab (all other authors)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               25.1%;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    // Anotes "Wector: pBluescript SK(-); Site_1: EcoRI; Site_2: // Notes "Wector: pBluescript SK(-); Site_1: EcoRI; Site_2: // Notes "Wector: pBluescript SK(-); Morex (mla) plants were greenhouse grown in the R Wise lab at lowa State University, Ames, IA; 7 day old green seedlings were infected with isolate 5874 of Blumeria graminis f. sp. hordei, and leaves were harvested 24, 48 and 72 hr post-inoculation and snap frozen (Wise). In the TJ Close lab at the University of Callifornia, Riverside, total RNA was prepared from each sample pool, equal quantities of all three RNA pools were combined, poly(A) RNA was purified from the mixture, one primary unamplified cDNA library was made, and 1 million pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids (Chin). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of bred value 20 or

Patent No. 6211433

GENERAL INFORMATION:
APPLICANT: Simmons, Carl R.
TITLE OF INVENTION: Methods and Compositions to TITLE OF INVENTION: In Plants
FILE REFERENCE: 5718-42A-- Mlo3
CURRENT APPLICATION NUMBER: US/09/350,268
CURRENT FILING DATE: 1999-07-06
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Qy
